Row Store / Column Store

Referential "in large"

# Row Store

Instance de BDD / Cache

## Row Page:

|   |   |    |   |   |   |
|---|---|----|---|---|---|
| 1 | A | 10 | 2 | B | 8 |
| 3 | C | 15 | 4 | D | 7 |

id (int)

nom (char)

Prix (int)

- Nb d'unités en stock ?
- Prix total moyen ?

## Column

Page Colonne id

|   |   |   |   |
|---|---|---|---|
| 1 | 2 | 3 | 4 |
|---|---|---|---|

Page col Nom

|   |   |   |   |
|---|---|---|---|
| A | B | C | D |
|---|---|---|---|

Col-Prix

|    |   |    |   |
|----|---|----|---|
| 10 | 9 | 15 | 7 |
|----|---|----|---|

Prix Moyen = ?

Compression

RLE

Repeat Length Encoding

1 | A

2 | B

C / C++

```
int funct ( int i ) { }
```

```
int * pf() = funct ( int i ) { };
```

```
int * pf() = funct;
```

```
int res = pf( 10 );
```

funct()

other funct()

funct2( \* pf(int) )

Prog fonctionnelle = passer une fonction en argument à une fonction

operation 1( operation 2 )

- C++ , python, java, C# → ou fonctionnel
- C# → Délégués → fonctions anonymes → Lambda expr -
- java → fonctions anonymes → API Stream (map, reduce, ...)

Langages "fonctionnels" → N'a pas langages simplifiés en fonctionnels

- .net F# produit du .net
- java Scala produit du bytecode java

---

NIFI / ETL Batch

Extract  
Transform  
Load

Solutions ETL

Microsoft SSIS

Oracle ODI

Talend (open source)

Informatica / SDI  
génie

Batch <sup>(Pull)</sup> → . Execution planifiée d'un processus  
 - Traitement par batch d'un lot de données.

Flux <sup>vs (Push)</sup> → - Exécution au fil de l'eau  
 - Traitement par donnée entrante

Pull → scruter, aller chercher la donnée(s)

Push → attendre, recevoir la donnée

NIFI → - Mode flux (Push)  
 - Cluster Nifi

ETL → Batch, relationnels

ELT → Flux, Big Data

Extract Load Transform

Nifi est un ELT et ETL

T est moins fonctionnel que le  
Batch (moins puissant)

Kernal.org →

Noyau Lin.

Distribution →

Fichiers

= 1 Instance Linux.

Normalisation / Dénormalisation

Base Référentielle

MS SQL Server, Oracle, ...

Relation,  
Contrainte d'intégrité  
Référentielle

Dénormalise:

| Produits |         |             |
|----------|---------|-------------|
| id       | nom Cat | nom Produit |
| 1        | Boisson | chai        |
| 2        | Boisson | chang       |

Plan Vois en  
relationnel

OK  
- On DataMart  
- No Sql

Data:  
Relationnel  
Normalisé  
Cohérent  
lent

Dig Data  
Non Relationnel / dénormalisé  
Rapide  
Eventuellement  
cohérent

Table - Products  
- Commandes

Normaliser :

Big Data / Dénormaliser

Cassandra

MongoDb

injection de contenu

cluster Cassandra

Serveurs

cluster MongoDB

HA

Serveur:

Pandora FMS

- Process principal

- CROND

- NTPD

- Postfix

~~mauvaise pratique~~

Image / Conteneur

① Communication Réseau ② Montage de dossiers  
→ Bonne Pratique

→ Ex le Images → lancer le Conteneurs

→ Volumes

→ Ports

→ ordre de démarrage

→ etc....

IPFMS

CRON

NTP

Postfix ....

Encapsuler les ordres

docker container RUN ....

Dans un script shell → ~~mauvaise~~  
Pratique !

# Cycle de vie de l'infra (Exemple)

Créer un script pour chaque cas d'erreur et alternatif!

Impératif - (lignes de code) → OK pour des "algorithmes"  
- utilisable pour de simples infrastructures

Déclaratif - → OK pour de l'infrastructure

## Word press

## Côté Dev / Test

Developper au format Docker-Compose  
(yaml)

## Côté Prod

Dev. format  
Kubernetes  
(yaml)

- Ecrire l'App

- Ecrire le Dockerfile

(Ecrire le docker-compose si tests locaux)

- Ecrire le déclaratif Kubernetes -

2 couches
